

COURIER DELIVERY DASHBOARD

MODEL

General Performance Overview

- **Total Ordered Value:** 23 million
- **Average Order Price:** 112.70
- **Number of Orders:** 60,000
- **Average Delivery Time:** 19.96 minutes

Trends Over Time (August 24 – September 8)

- There is a **steady increase** in both **total order value** and **number of orders** from August 24 to early September.
- **Peak values** were recorded on **September 4** with a total order value of **2.4M**.
- A **drop in performance** is visible around **September 5 and 6**, with both order value and number of orders decreasing.
- Recovery begins again on **September 7–8**, showing upward movement.

Average Delivery Minutes

- Delivery time remained **relatively stable**, averaging close to 20 minutes.

- Slight **fluctuations** are visible, with the **highest delivery time** around **August 28** and **September 3**, but differences are marginal (~0.2 minutes).

Performance by Day of Week

- **Best-performing day: Thursday**, with the highest order value of **4.1M**.
- **Sunday** also shows strong performance (**3.6M**), despite typically being a lower-activity day in many industries.
- **Friday** has the **lowest order value (2.6M)**, indicating potential for improvement in weekend operations.
- Overall, the business performs well throughout the week, with **balanced order distribution**.

Trend Over Time (Aug 24 – Sep 8) by Gender

- Both **male (blue)** and **female (purple)** couriers show a **steady increase** in delivery value over time.
- Male couriers consistently contribute a **larger share** of the total delivery value throughout the period.
- The **gap between male and female couriers** remains **stable**, suggesting consistent performance patterns.

Total Ordered Value by Day and Gender

- **Male couriers** deliver a **higher total value** across all days of the week.
 - The **highest performing day** is **Thursday**:
 - **Male couriers:** 2.3M
 - **Female couriers:** 1.6M
 - **Lowest performing day for both genders:** **Friday**
 - Male: 1.5M
 - Female: 1.0M
 - The **most balanced day** in terms of contribution is **Monday** (Male: 1.8M, Female: 1.3M).
-

Gender Distribution Insights

- **Male couriers consistently outperform female couriers** in terms of total order value, suggesting higher delivery volume, longer routes, or higher-value orders.
- **Female courier contribution remains steady**, indicating reliability and consistency despite the volume difference.

Trends Over Time (Aug 24 – Sep 8)

- The **25–35 age group (light blue)** is the **dominant contributor** to total order value every day.
- The **35–45 age group (blue)** also contributes significantly but less than the 25–35 group.

- Couriers aged **18–25 and over 45** contribute much **less**, almost negligible in total share.
 - All age groups show a **stable or slightly increasing trend** in performance over the analyzed period.
-

Performance by Day and Age Group

- The **25–35 age group** consistently delivers **above 2M** in value across most days, peaking at **2.8M on Thursday**.
 - The **35–45 group** contributes between **0.6M and 0.9M** per day, also peaking on Thursday.
 - Minimal contribution from couriers **under 25 and over 45**, indicating lower involvement or volume.
 - **Thursday and Sunday** are again the **highest-performing days**, aligning with previous dashboards.
-

Key Insights

- Couriers aged **25–35** are the **core workforce**, responsible for the bulk of delivery value.
- The **35–45 group** plays a secondary but still significant role.
- **Younger (18–25)** and **older (>45)** couriers may need more support, training, or may work fewer hours or lower-value routes.
- Performance is **highest mid to late week**, especially **Thursday**, suggesting this is a peak demand day.

Scatter Plot: Delivery Time vs. Delivered Value per Order

- Most couriers are clustered between **350–500** in delivered value per order and **8–10 min** delivery time.
- There's a **positive trend**: couriers who deliver **higher-value orders** often require slightly **longer times**, likely due to order size, complexity, or delivery distance.
- There's **no extreme inefficiency** — even those with high delivery times tend to compensate with **high-value orders**.

Refined Conclusions

- The **delivered value per order** is a strong metric of courier productivity — and overall, it is **high**, averaging nearly **383 per order**.
- Top-performing couriers** are not only fast but also handle **high-value deliveries**, showing good resource allocation.
- Slightly **longer delivery times** can be acceptable if the **delivered value justifies** it.
- Courier performance evaluation should focus on **balance**: minimizing delivery time **without compromising delivered value**.

1. Balanced Spending Between Genders

- Both **female and male users** contributed **almost equally** to the total ordered value.
 - Example: On Sunday, each gender contributed **1.6M** to the total.
- This suggests that **marketing and engagement strategies are equally effective** across genders.

2. Peak Activity on Thursdays

- The **highest total ordered value** occurred on **Thursdays** (1.9M males, 1.8M females).
- Indicates **Thursday is the most active day** for both male and female users — a potential day to:
 - Launch promotions
 - Send targeted marketing
 - Test new features

3. Order Cancellations by Gender

- Canceled orders show **no significant gender imbalance**, but the volume of cancellations **increased steadily** until around **September 4**.
- After that, cancellation rates dropped — possibly due to:
 - Operational improvements
 - Policy changes
 - External factors (weather, demand changes, etc.)

4. Daily Trends

- User activity **increased steadily** in late August and **peaked** in early September.

- Similar growth trends were observed for **both order value and cancellations**, indicating that cancellation rates **scaled with volume** rather than indicating dissatisfaction.

Key Conclusions by Age Category

1. Dominant Age Group: 25–35

- The **25–35 age group** clearly dominates both in:
 - Total order value**
 - Order cancellations**
- For example, on **Sunday**, they contributed **2.7M**, compared to **0.5M** from the 35–45 group.
- This group is the **most active and valuable user base**, making them a **primary target for campaigns**.

2. Stable Activity from Other Age Groups

- Users aged **35–45** show consistent but lower engagement (around **0.5M per day**).
- Very minimal contribution is visible from the **18–25** group.
 - Indicates lower engagement or possibly untapped market potential.

3. Peak Day: Thursday

- Highest total value from all age groups occurs on **Thursdays** (total over **3.7M**, with **3.1M** from 25–35).
- This aligns with gender analysis and courier dashboards — Thursday is the **most commercially active day**.

4. Cancellations Mirror Orders

- Cancellation trends **mirror the ordering trends**.
 - Majority of cancellations also come from the **25–35 group**, but this likely reflects their higher volume.
- No age group shows unusual cancellation behavior that would suggest dissatisfaction.

📌 Insights & Recommendations

- Focus **promotional and retention efforts** on the **25–35 age group**, especially around **Thursdays**.
- Consider strategies to **increase engagement** among **18–25-year-olds** (student discounts, trend-based campaigns, social media).
- Since **cancellation patterns follow order volume**, there is **no major concern** related to age-specific dissatisfaction.

🌳 Product Popularity (Tree Map)

- The tree map shows the **share of each product in total ordered quantity**.
- Top products by order share (~2% each) include:
 - Bread (хлеб)
 - Chicken (курица)
 - Sugar (сахар)
 - Black tea (чай черный)
 - Bananas (бананы)
 - Milk (молоко)
 - Condensed milk (сгущенка)
 - Instant coffee (кофе растворимый)

This highlights **basic staples and common grocery items** as most ordered.

Price Category Distribution

- **Number of Products Ordered per Price Category:**
 - The majority (117K) of ordered products fall into the **lowest price category**.
 - The **lower price** category has 52K ordered products.
 - Very few products in **higher price** categories.
 - **Total Value by Price Category:**
 - Despite the volume in lowest categories, value is more evenly spread with:
 - ~6.1M in the lowest price category
 - ~6.0M in the lower price category
 - ~5.3M in the middle price category
 - ~0.8M in higher price categories
-

Insights & Recommendations

- Customers mainly purchase **low-cost staple goods** in large volumes.
- Value distribution suggests that **middle-priced items contribute significantly** despite smaller volumes.
- Focus promotions on **staples like bread, chicken, milk, and sugar** for volume sales.
- Explore marketing strategies to **increase sales of mid- and higher-priced items** for better margins.
- Keep pricing competitive in **lowest and lower price categories** to maintain order volume.
